

Comparison of EML latency of Canadian access switches

Overview

Enter two addresses or cities to calculate the distance and latency. To calculate the latency for each packet in the system the switch compares the ingress with the egress timestamp. The feature allows you to display historical latency averages between all pairs of. Here we refer to latency as round-trip time, which includes both the time it takes for the packet to be sent and the acknowledgment it has been received. Specific Components: Process Time for Ingress: Reception of packets, buffering, and initial. Run a global latency test! Benchmark your CDN provider and understand how the network performs! Compare DNS providers to find the fastest one globally or in your region. Understanding network latency is crucial for network.
