

Does a PoE switch need cooling

Overview

Yes there are extra cooling requirements. POE uses more current, current equals heat - so yes you need more cooling (and power of course, in fact choosing the best PSUs for POE-equipped Cisco Cat 65xx's can be more than a 2 minute decision). If you have a 80% efficient. Especially under the IEEE 802.3bt standard, 100W-level power transmission generates more heat, and if cooling is insufficient, the risk of power interruption significantly increases. Internal processors, network chips, and other components frequently enter underclocking or protection modes under. A PoE switch is a regular Fast Ethernet or Gigabit network switch that has Power over Ethernet functionality integrated. A Power over Ethernet switch both enables communication among network clients and provides power using the same RJ45 network cable to PoE-enabled edge devices, such as VoIP. Am putting in a Fortigate firewall/router and a Cisco 2960 48 port POE switch. I don't think I need AC based on all the specs.
