

FDDI Connector Tracking Resistance and Selection Guide Performance Comparison

Overview

Fiber Distributed Data Interface (FDDI) is a standard for data transmission in a local area network. It uses optical fiber as its standard underlying physical medium. It was also later specified to use copper cable, in which case it may be called CDDI (Copper Distributed Data Interface), standardized as TP-PMD (Twisted-Pair Physical Medium-Dependent), also referred to as TP-DDI (Twisted-Pair Physical Medium-Dependent). FDDI provides a 100 optical standard for in that can extend in length up to. Designers normally constructed FDDI rings in a such as a "dual ring of trees". A small number of devices, typically infrastructure devices such as and concentrators rather than host computers, were "dual. The frame check sequence uses the same as and. The defined a standard for transmission of the (which.
