

Length of anti-corrosion cable trays in China and Africa

AI Overview

Anti-corrosion cable trays are typically available in standard lengths of 2 to 3 meters, with customization options depending on manufacturer and project requirements.

Standard Lengths In China, anti-corrosion cable trays are commonly manufactured in standard lengths of 2 meters or 3 meters per section, which allows for modular installation and easier handling during transport and assembly. Some manufacturers, such as Shandong Tianhong Electric Power Technology Co., Ltd., offer customized lengths to meet specific industrial or infrastructure project requirements, including long cable runs in power plants, data centers, or chemical plants. In Africa, the lengths of cable trays are generally similar, as most projects import trays from international suppliers or follow IEC and BS standards, which align with the 2-3 meter modular sections. Local suppliers may also provide custom lengths to accommodate site-specific layouts, particularly in harsh or corrosive environments such as coastal or industrial areas.

Factors Affecting Tray Length

- Environmental Conditions:** Corrosive environments, such as coastal regions or chemical plants, may require shorter sections to reduce stress and allow for easier maintenance.
- Load Capacity:** Longer trays may need additional support to handle heavier cable loads without sagging or deformation.
- Installation Flexibility:** Modular lengths of 2-3 meters are preferred for easier handling, transportation, and alignment with structural supports.
- Material Type:** Anti-corrosion trays made from galvanized steel, aluminum alloys, or ZnAl/ZnMg coated metals may have different maximum recommended lengths due to weight and rigidity considerations.

Summary

- Typical standard lengths:** 2 meters and 3 meters per section.
- Custom lengths:** Available from manufacturers in China and for African projects depending on design requirements.
- Material and environment:** Corr...
