

Temporary distribution box grounding point

Overview

Inside the enclosure, a main lug or bus bar serves as the central point for the incoming hot, neutral, and ground conductors. From this bus bar, individual circuit breakers are installed to provide overcurrent protection for each branch circuit. This device safely takes power from a single source, such as a generator or temporary utility service, and divides it into. Temporary distribution boxes are indispensable at construction sites, events and temporary workplaces. When lightning strikes or a rogue voltage surge decides to crash the party, proper grounding steps in like a seasoned bouncer, redirecting danger away from. of contact to ground, is the important vari-able. It is the voltage divided by this resistance (Ohm's Law) that determines the mo ase in body resistance to as little as 1,000 ohms. Each DISTRIBUTION BOX and controller must be grounded. 26 mm 2 (10 AWG) ground wire must be used, and in all other markets a 6 mm 2 must be used.
