

Troubleshooting methods for high beam control module

Overview

Diagnose and fix automatic high beam problems with our step-by-step guide covering sensor failure, fuse issues, and DIY troubleshooting. Start by connecting an OBD-II scanner to the vehicle's diagnostic port. This tool will retrieve the U0180 code along with any other stored trouble codes. If your high beams are not working, the most likely cause is a blown fuse or a burned-out bulb — both of which you can check yourself in under 15 minutes. That said, there are seven possible culprits, ranging from simple fixes you can handle at home to electrical faults that need a mechanic's. Automatic high beam (AHB) systems, sometimes marketed under proprietary names like IntelliBeam or SmartBeam, are designed to enhance nighttime visibility by automatically switching between high and low beams. Whether you drive a classic model or a newer Mercedes, high beam issues can stem from various sources, including faulty bulbs, blown. High beams, often called brights, serve the singular purpose of significantly extending a driver's sight distance in extremely dark conditions, such as on unlit rural roads. These lights utilize a different filament or reflector position than standard low beams to project a higher, more intense. Auto High Beam is a safety feature that controls the headlight operation and lights up the road in front using low and high beams.
