

Why does the beam splitter break down What s wrong

Overview

Plate beamsplitters do not require optical cement to hold the two halves of the prism together. It is a crucial part of many optical experimental and measurement systems, such as interferometers, also finding widespread application in fibre optic telecommunications. In its. My light source is beamed onto a 50/50 beam splitter behind which sits my camera but I cannot seems to eliminate ghosting from the surface of the beamsplitter. I am not getting a usable image and would hugely appreciate some help. Beamsplitters are often classified according to their construction: cube or plate. Beamsplitters are optical devices able to either split an incident light beam into two separate beams or combine two incoming beams from distinct angles into a single output.
