

Why is the fiber optic cable on my router showing red

AI Overview

A constant red light on your router's fiber optic port indicates a Loss of Signal (LOS), meaning your router cannot communicate with your Internet Service Provider (ISP). Common Causes

Fiber Optic Cable Damage: Physical cuts, bends, or kinks in the fiber optic cable can disrupt the signal and trigger a red LOS light.

Loose or Improper Connections: If the fiber cable is not securely connected to the router or Optical Network Terminal (ONT), the signal may be lost.

Service Outage: ISP maintenance, local outages, or technical issues can cause the red light to appear until service is restored.

Router or ONT Malfunction: A faulty router or ONT may fail to detect the incoming optical signal.

Power Issues: Unstable power supply or surge protector problems can prevent the router from functioning properly.

Troubleshooting Steps

Check for ISP Outages: Visit your ISP's website, social media, or contact support to confirm if there is a known service disruption.

Inspect the Fiber Cable: Look for visible damage, sharp bends, or loose connections. Ensure the cable clicks securely into the WAN/ONT port.

Restart Your Router: Power off the router, unplug it for 30 seconds to 2 minutes, then reconnect and turn it back on. Wait a few minutes for the LOS light to change.

Verify Power Supply: Plug the router directly into a wall outlet if using a surge protector, and ensure the power cable is firmly connected.

Replace or Test Cables: If the fiber cable appears damaged, try a spare cable or request a replacement from your ISP.

Contact ISP Technician: If the red light persists after these steps, an on-site technician may be required to check the fiber line or router hardware.

Additional Tips

Avoid bending the fiber cable sharply, as it is sensitive to stress. Keep the router in a well-ventilated area to prevent overheating, which can affect connectivity. Regularly check for firmware updates via your router's admin p...
