

Wireless Router Fiber Optic Connection Setup

AI Overview

To set up a wireless connection on a fiber optic router, connect the fiber optic line to the ONT or modem, link it to your router via Ethernet, and configure the router's Wi-Fi settings.

Required Equipment

- Optical Network Terminal (ONT) or fiber modem: Converts the fiber optic signal into an electrical signal your router can use
- Compatible router: Ensure it supports fiber connections, typically via a WAN or SFP port
- Fiber optic cable: Usually SC/APC or SC/UPC connectors
- Ethernet cable: To connect the ONT/modem to the router
- Computer or mobile device: For router configuration

Step-by-Step Setup

Connect the Fiber Optic Cable: Plug the fiber optic cable from the wall outlet into the ONT or fiber modem. Power on the ONT and wait for the status lights to stabilize.

Link ONT to Router: Use an Ethernet cable to connect the ONT's LAN port to the router's WAN port. Power on the router and wait for the connection to establish.

Access Router Settings: Open a web browser and enter the router's IP address (commonly 192.168.0.1 or 192.168.1.1). Log in using the default credentials (often "admin"/"admin") or your custom login.

Configure Internet Connection: In the router interface, select the connection type (DSL, fiber, or via modem) and enter any account information provided by your ISP. For some routers, you may need to configure VLAN IDs or speed settings.

Set Up Wireless Network: Navigate to the wireless settings section. Configure your SSID (network name) and Wi-Fi password. Use strong encryption (WPA3 or WPA2) for security.

LAN and IP Configuration: Optionally, configure the router's LAN IP address and subnet mask to avoid conflicts with other devices on your network.

Save and Reboot: Apply the settings and restart the router. Verify that the WAN light is active and that your devices can connect to the Wi-Fi network.
